SURFACE TECHNOLOGY, INC. GOES SOLAR

Feb 1, 2007 – TRENTON, NJ – Surface Technology, Inc., a world recognized leader in electroless nickel coatings, moves to the forefront again by making the switch to “green power.” The Company has filed the necessary papers with the State of New Jersey to install state of the art solar electric generating panels across the roof of its production plant. The move will give STI an energy efficient system that is pollution free, reduces the use of imported sources of fuel, has sustainability in the event of any power failures, and will allow the company to give back to its community.

Over the last two decades STI has prided itself on environmental awareness in all aspects of production, and in that respect, investing in to solar power comes as no surprise.

STI holds more than 90 patents which have helped establish its reputation as an innovative leader in the metal finishing industry. Now STI will become one of over three hundred companies in the state operating on solar power, making New Jersey second only to California in renewable energy, and pushing STI, yet again, into the industry spotlight.
